Application No. 10/578,585 Amendment Reply to Office Action of December 27, 2007

Amendments to the Abstract:

Please substitute the following version of the Abstract, with changes shown by strikethrough (for deletions) or underlining (for added matter).

ABSTRACT OF THE DISCLOSURE

An electrotherapy apparatus emprising has a sensor for detecting periodically recurring signal peaks, in particular the R-R peaks of an electrocardiogram of a person[[,]] and a processor for deriving from said the periodically recurring signal peaks a time delay corresponding to approximately the end of the next T-wave, a T-wave. A trigger system or circuit is initiated by an output signal of said the processor or is embodied within said the processor for applying electrical stimulations to one or more active electrodes provided on the said person at a time that is related to the end of said the time delay. is characterized in that the The apparatus has a plurality of output channels for applying electrical stimulation to said the one or more active electrodes provided on the said person.
